Research Interests

My research investigates the organization of large-scale cortical networks, primarily through the analysis of intrinsic activity measured with functional magnetic resonance imaging (fMRI). I have developed approaches for mapping connectivity gradients that situate cortical areas along continuous axes of organization, conducted cross-species comparative neuroanatomical studies of these axes, and related their variation to phenotypic differences across individuals. My current research addresses how cortical geometry constrains the topography of function and the integration of sensory information along the cortical hierarchy.
